International Recognition

Accessibility

The park is accessible through all means of land transportation. Its distance is 15 km from Pasay Rotonda; 8 km from Quiapo, and 5 km from Cubao. It is located along Quezon Avenue, a major route of public transportation in Metro Manila. Travel time is approximately one (1) hour by motor vehicles depending on the situation of traffic.

There are two entrance gates to the park; one is located along Quezon Avenue and the other in North Avenue. Both gates are along routes of all kinds of land transportation. Inside the park is a three-kilometer asphalt road. There are signposts and trails that serve as guide to picnic areas as well as to other significant features of the park.

PHYSICAL FEATURES

TOPOGRAPHY AND SLOPE

Highest Elevation

45.00 meter(s)

Lowest Elevation

38.00 meter(s)

Map description

1) It has a relatively flat terrain consisting of low-lying areas rolling down to southern portion of the park. The elevation of NAPWC ranges from 37.7 meters above sea level (masl) at the southernmost portion of the area to 44.6 masl at the northernmost portion of the park. It has a man-made lagoon of about 4.0 hectares in size located at the north-western portion of the territory. It is also dissected by an island found at the inner portion of the lagoon. The slope of the park has a high degree of suitability (within slope range of 0 to 8 percent).

Map description

1) Soil is relatively shallow, about 30cm to 50 cm depth. The parent material is adobe rock. Portions of the area are eroded despite the presence of trees. Some portions of the park are merely landfill. Due to its flat topography, during heavy rains, most of the sites are easily flooded, but the water easily subsides when the rain stops. According to PECAYO-2004, the essential microelements in the soil are present which includes Nitrogen, Phosphorous, and Potassium. The average soil ph level is 7.26 (slightly alkaline). The soil's physical characteristic is generally sandy clay loam which may be the reason for the easy recession of water. It also has about 41.4% organic matter. Being near the lagoon, the park has a high degree of suitability which makes the soil alluvial (silty loam) therefore, it is deep and permeable as the soil texture size ranging from .002 to .05mm.
